

# Contractor Review and Proof System

Core Implementation Guide  
Version 1.0

## Product Overview

The Contractor Review and Proof System helps a home service contractor turn completed work into honest customer feedback and recent project proof. It is an operating process, not a promise of rankings, calls, or a specific number of reviews.

The process is simple: complete the job, confirm customer readiness, request honest feedback, capture project proof, record the activity, publish appropriate proof, and review weekly performance.

## Why Reviews and Project Proof Work Together

Reviews help homeowners understand customer experience. Project proof helps them see completed work. Used together, they make the business feel current and active without relying on exaggerated claims.

A contractor with good work but old reviews or no recent photos can look less active than a competitor. The fix is a routine that captures proof while the job is still fresh.

## Implementation Order

Start with the review process worksheet. Customize the scripts only after eligibility, timing, owner, and reminder rules are clear. Then create the direct review link, set the photo routine, publish weekly proof, and track execution.

Use the 30-day checklist to avoid doing everything at once. The first month should establish the routine, not perfect every asset.

## Review-Process Principles

Ask for honest customer feedback. Do not offer rewards for positive reviews, ask only customers expected to leave five stars, or tell customers what to write.

Pause the request when there is an unresolved complaint, safety concern, billing dispute, or open callback. Handle the issue first.

## Project-Proof Principles

Capture before, during, and completed-work photos when safe and appropriate. Avoid private customer information and get permission before publishing project proof.

Use general service locations such as city or neighborhood only when the customer has agreed and when it does not expose sensitive information.

## Publishing Cadence

Set one weekly publishing block. Choose one recent review theme, completed job, project photo set, or proof update. Publish where the content fits the platform and the permission is clear.

A steady weekly routine is better than a daily posting plan the team will not maintain.

## Tracking Guidance

Track eligibility, request date, request channel, reminder date, review received, photos collected, permission confirmed, publication dates, responsible team member, status, and notes.

Do not store unnecessary sensitive customer details. Use a customer or project reference that your team understands without putting private information into a marketing tracker.

## Troubleshooting

If requests are low, check whether the handoff is missed. If reviews are low, check timing, friction, and reminder use. If publishing is low, check photo collection and permission.

If a customer gives private praise, thank them and invite honest public feedback. If a customer raises a problem, route it to service recovery before asking for a review.

## Maintenance Routine

Every week, review completed jobs, eligible customers, requests made, reviews received, responses completed, photos collected, proof published, bottleneck, and next corrective action.

Every month, choose the next target: increase request consistency, improve photo capture, publish more recent proof, or tighten review responses.
